"Hypnotherapy as Part of a Spa Treatment."

Prague, Activitas Nervosa Superior, Vol 8, No 2, Jun 66, pp 223-224

Abstract: Hypnotherapy of psychogenic somatic disorders as part of a spa treatment is discussed. Barbiturates were administered before the inducement of hypnotic sleep so that the patients would submit to the hypnotic effect more readily. 55 patients with a secondary diagnosis of neurosis and/or psychosomatic disorders were investigated. 15 patients improved permanently, 30 partly; no records were obtained from the remainder. The treatment lasted 3 weeks; longer treatment is recommended. Very good results were achieved in acute psychic failures and in post-traumatic neuroses. No references. Submitted at the 4th Conf. of Exper. and Clin. Study of Higher Nerv. Functions at Mar. Lazne, 12-15 Oct 65. Article is in English.

TITLE: An investigation of magneto-elastic effects in ferrites

PERIODICAL: Fizika metallov i metallovedeniye, v. 14, no. 6,
806 - 813

TEXT: An experimental study was made of the dependence of the magnetic properties of ferrites on unilateral elastic stress (compressive and tensile) in direct and alternating magnetic fields. Measurements were made by a ballistic method using a closed magnetic circuit, the compressive and tensile forces being obtained in a special apparatus which can simultaneously magnetize the sample. The yoke of the apparatus is constructed from armco iron and consists of two equal parts which are free to move axially with respect to each other. Magnetizing coils were mounted symmetrically on both parts of the yoke and a signal coils is mounted at the middle of the specimen. The induction B and the residual induction B_r pass through a maximum (the Villari point) as the load σ is increased on the ferrite; the magnetostriction λ also goes through a maximum and reverses sign at $\sigma = 400 \text{ kg/cm}^2$ for the

ferrite $\text{Ni}_{0.88}\text{Zn}_{0.1}\text{Co}_{0.02}\text{Fe}_2\text{O}_4$. These effects are analogous with earlier results on Fe-Ni alloys. The dependence of dynamic magnetic permeability on the compressive elastic stress was investigated for the following ferrites: a) $\text{Ni}_{0.99}\text{Co}_{0.01}\text{Fe}_2\text{O}_4(\text{Fe}_2\text{O}_3)_x$ for $x = 0, 0.01, 0.02, 0.03$ and 0.04 ; b) (i) $\text{Ni}_{0.3}\text{Zn}_{0.7}\text{Fe}_2\text{O}_4$; b) (ii) $\text{Ni}_{0.88}\text{Zn}_{0.1}\text{Co}_{0.02}\text{Fe}_2\text{O}_4$; b) (iii) $\text{Ni}_{0.93}\text{Zn}_{0.05}\text{Co}_{0.02}\text{Fe}_2\text{O}_4$; b) (iv) NiFe_2O_4 ; b) (v) $\text{Ni}_{0.99}\text{Co}_{0.01}\text{Fe}_2\text{O}_4(\text{Fe}_2\text{O}_3)_{0.04}$. In the case of a) ferrites the permeability falls off more steeply with load as the value of x increases; similarly for the b) ferrites the permeability decreases progressively more steeply as we go from (i) to (v). An examination of the effect of the demagnetization factor on the value of the magneto-elastic susceptibility is made and a criterion is proposed for estimating the magneto-elastic properties of different materials, namely:

This booklet on the planning of beamless ceilings reflects domestic achievements in the field of calculation and design of ceilings of this type. The booklet gives accounts of the stages of disintegration, with calculations of the redistribution of stresses following plastic deformations, and treats the peculiarities of erecting beamless ceilings, the arrangement of concrete molds, etc.

The booklet is intended for engineer designers, production workers, scientific workers.

SOV/12-59-8-5/17

TITLE: Glass - Concrete Heating Panels (Steklobetonnyye otopitel'nyye paneli)

PERIODICAL: Steklo i keramika, 1959, Nr 8, pp 4-8 (USSR)

ABSTRACT: The Gosudarstvennyy nauchno-issledovatel'skiy institut stekla (State Scientific Research Institute for Glass) and Nauchno-issledovatel'skiy institut sanitarnoy tekhniki Akademii stroitel'stva i arkhitektury SSSR (Scientific Research Institute of Sanitation Technology of the Building and Construction Academy, USSR) have developed a glass-concrete heating panel which is now being tested in operation. It is shown in figure 1. The prototype of the apparatus was a similar construction by Engineer Yakhimovich, in which, however, steel tubes were used instead of glass tubes. Investigation of the glass-concrete panels started in 1955, the main task being that of rendering possible the cooperation of glass and concrete, having different coefficients of thermal expansion. The tube coils (inside diameter 12-15 mm, wall thickness 3.0-3.5 mm) were made of weakly alkaline glass Nr 15 v and welded by means of rods of

Card 1/3

Glass-concrete Heating Panels

SOV/12-59-8-3/17

the same glass and then annealed. The welded glass tubes were examined with respect to possible tensions resulting from the welding process by means of polariscope PKS-500. The panels were made of concrete M-200 with a coarse grain of up to 20 mm and then kept in a steam chamber for 18-20 hours. The finished panels were then tested hydraulically for five minutes at a pressure of 8 atm. In the years 1956-57 nine glass-concrete panels were examined in the test plant (Fig 2) at the Institute Sanitation Technology. The best combination design proved to be the one shown in figure 3. The panels were tested in operation in a four-storied Moscow apartment house. A room with two panels is shown in figure 4. The panels proved their practical value during two heating periods (1957/58 and 1958/59). Figure 5 shows the axial tension in the glass coils as a function of the temperature of concrete binding. Figures 6-9 show the results of successful laboratory investigations of glass-concrete panels P-1A and P-1V with respect to their unilateral and bilateral heat emission. Preliminary calculations showed that in the case of mass production the panels under consideration will be 10 to 15% cheaper than cast-iron radiators.

Card 2/3

Glass-concrete Heating Panels

SOV/72-59-8-3/17

By replacing 10% only of the cast-iron radiators produced annually by glass radiators 60,000 t of metal will be saved (estimated on the basis of the 1960 program). It has been decided to start industrial production of the glass coils at the Buchanskiy glass works of the Kiyev Council of National Economy. There are 9 figures.

TITLE: Problem of protection of steel rods from corrosion

SOURCE: Beton i zhelezobeton, no. 1, 1966, 3-7

TOPIC TAGS: corrosion protection, steel structure, protective coating, polymer, metal etching

ABSTRACT: In this same journal, No 3, 1965, the authors of this article suggested an effective method of anticorrosion protection of steel connectors used in large-panel buildings. This article presents additional material on the same subject. The article is also an answer to the questions in a number of letters received by the editors and authors after publication of the first article. The authors state that in their method, based on the application of coatings to specially cleaned steel surfaces, it is necessary to perform careful control over the preliminary preparation of the parts, especially when acid etching is used, as well as control of the thickness of the protective coating. The best results were attained with the usage of combined zinc-polymer coatings.

547. NITRO-PENTO-PHTHALIC PAINTS IN INDUSTRY AND THEIR EFFECTS ON WORKING CONDITIONS FROM THE SANITARY-HYGIENIC POINT OF VIEW. (Russian text) Chernyavskii M.I., Ivzerov A.K..

Sheinin B.Ya. VRAC. DELO 1956, 10 (1069-1070)

Enamel paints of the 'N. P. Ph.-10' type are being used in machine manufacturing plants. These nitro-pento-phthalic paints contain lead compounds, 3% butanol, 25% toluene and xylene. The use of these enamel paints in special chambers provided with powerful ventilation and hydro-filters has improved the working conditions as confirmed by testing the air for lead, benzene and amyl acetate content. Noxious substances were found to be absent or present in concentrations not exceeding permissible limits. The use of 'N. P. Ph.-10' enamel paint requires special organization of work according to special instructions, proper storage and delivery to the plant in closed containers as it is easily inflammable.
